Recommended Hullbridge mooring specification

# MOORINGS

An acceptable U.R.Y.C. formula for a mooring is:

30 feet of ground chain with sinkers 24 feet apart, giving a lift of approximately 9 feet.

Approximately 9 / 10 feet of riser chain to the mooring buoy, depending on where exactly your mooring is located, fixed at one end to the centre of the ground chain with a swivel shackle and at the other end to the mooring buoy with another swivel shackle.

Ground chain for all boats should be  $\frac{1}{2}$ " chain (minimum) and riser chain should be  $\frac{5}{16}$ " chain (minimum); all to be in good order.

Buoy to have mooring number and boat name if possible painted on it.

## IDEAL SITUATION

- ABC = 30 feet length of ground chain
- AC = 24 feet distance between sinkers
- BD = 9 feet height of lift
- BE = 9 / 10 feet length of riser chain (between ground chain and mooring buoy)
